

DeepLearning

CNN Architectures

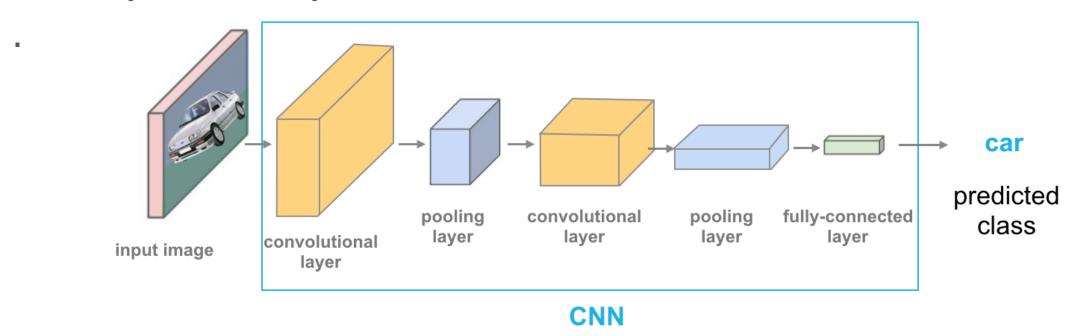

- LeNet
- AlexNet
- VGG
- GoogLeNet
- ResNet

Convolutional Neural Network

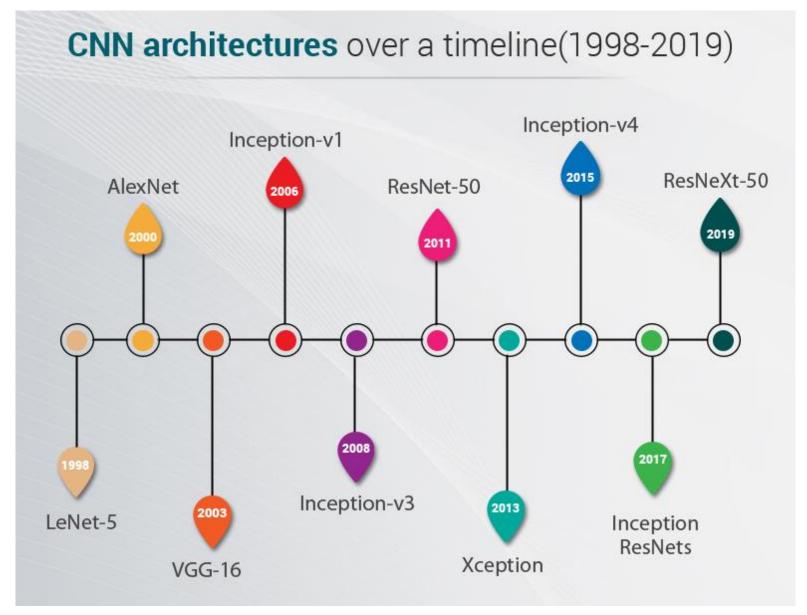

- In a convolutional network (ConvNet), there are basically three types of layers:
 - 1.Convolution layer
 - 2.Pooling layer
 - 3. Fully connected layer

After each convolution there is non-linearity applied using activation functions- Relu/Leaky Relu. H1=g(a1)

Different CNN Architectures

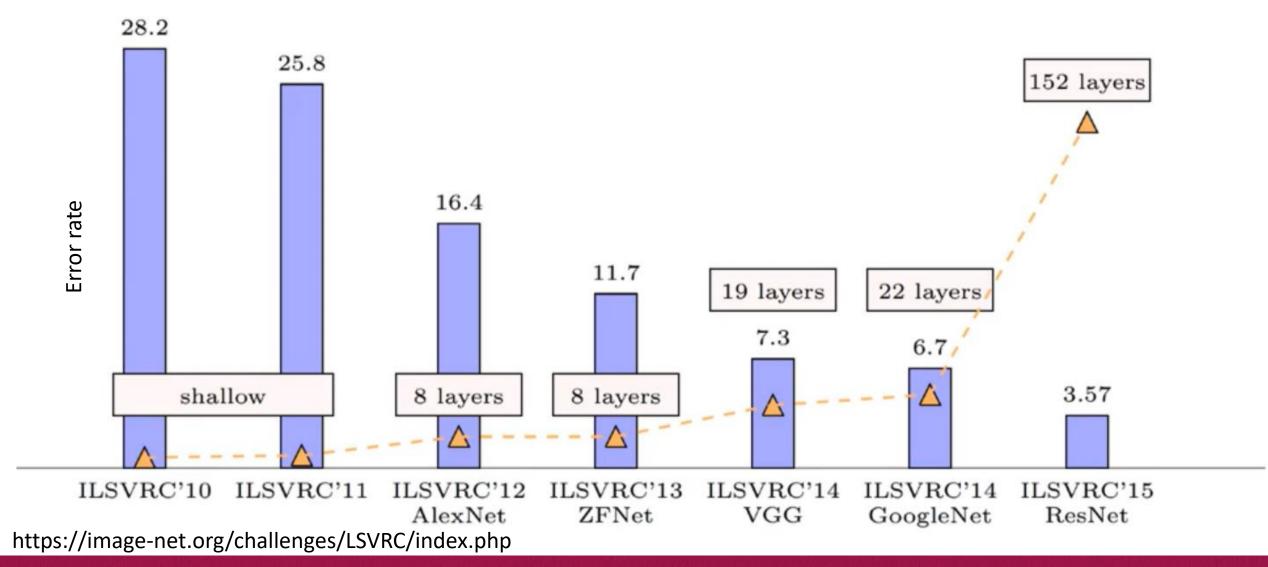

- No: of Layers: How many convolutional, max pooling fully connected layers?
- No: of Filters in each layer
- Filter Size
- Max pooling: What arrangement? 2 convolutional and then maxpooling or alternate convolutional and maxpooling?

Use standard tried and tested architectures!

ImageNet Large Scale Visual Recognition Challenge (ILSVRC)

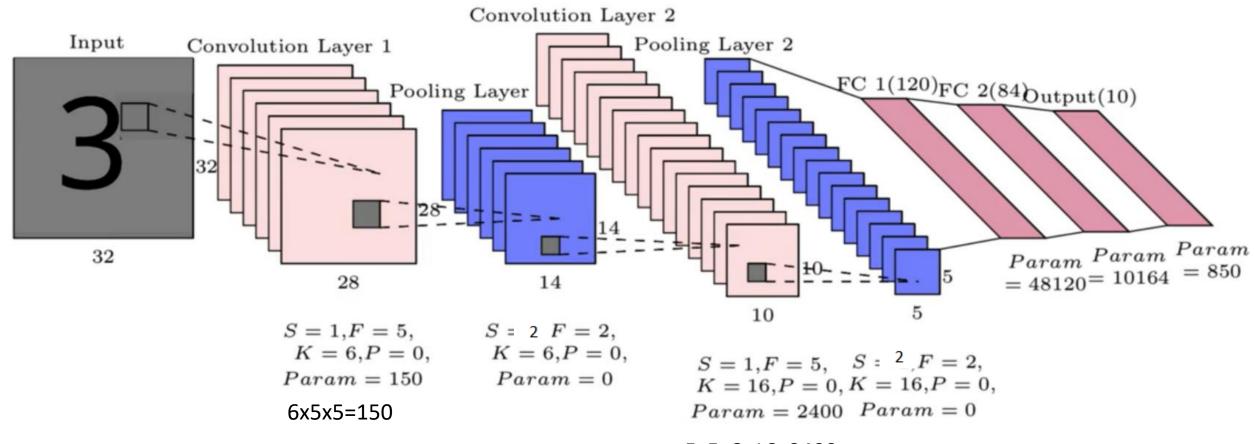

CNN Architecture

LeNet

LeNet-5 – First CNN Architecture

Earliest pre-trained models proposed by Yann LeCun and others in the year 1998, in the research paper <u>Gradient-Based Learning Applied to Document Recognition</u>. They used this architecture for recognizing the handwritten and machine-printed characters.

Depth of filter is always depth of the input

5x5x6x16=2400

After each convolution there is non-linearity applied using activation functions- Relu/Leaky Relu. h1=g(a1)

LeNet-5 – First CNN Architecture

Calculation of no of parameters

Conv Layer 1

$$S = 1, F = 5,$$

 $K = 6, P = 0,$
 $Param = 150$

S=1,F=5,K=6 W0=(32+0-5)/1+1=28, As no of filters 6 we get 6 outputs of 28x28 (Filter size 5x5) No: of parameters= 5x5x6=150

[Comparing with fully connected Flatten 32x32 Flatten 28x28x6 Total parameters = 32x32x28x28x6]

Conv Layer 2

$$S = 1, F = 5,$$

 $K = 16, P = 0,$
 $Param = 2400$

S=1,F=5,K=16 W0=(14+0-5)/1+1=10, As no of filters 16 we get 16 outputs of 10x10 from 6 input images(Filter size 5x5)

No: of parameters= 5x5x6x16=2400

[Comparing with fully connected 14x14x6x10x10x16]

FC1

Flatten 5x5x16=400 neurons Hidden layer size=120 Bias from each node comes to 120 Parameters = 400x120+120=48120

FC2

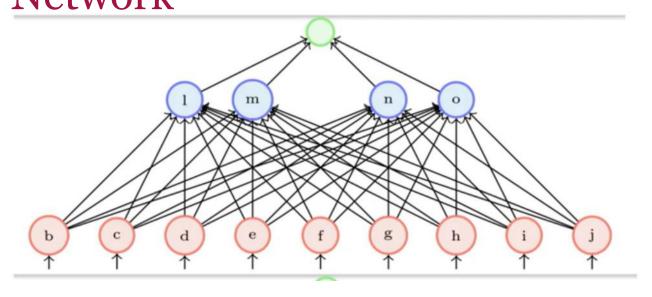

Hidden layer 1 size= 120
Hidden layer2 size =84
Bias from each of 84 hidden layer
neuron=84
No of parameters=
120x84+84=10164

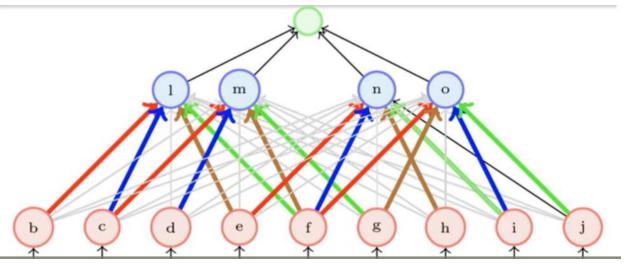

FC3

Hidden layer 1 size= 84
Hidden layer2 size =10
Bias from each of 10 hidden layer neuron=10
No of parameters= 84x10=850

How to train a Convolutional Neural Network

- A CNN can be implemented as a feedforward network
- wherein only a few weights (in color) are active
- the rest of the weights (in gray) are zero

Deep learning frameworks have optimized codes which does not have to do the zero weight calculations or storage

Convolutional Neural Network Architectures AlexNet

AlexNet is the name of a convolutional neural network (CNN) architecture, designed by Alex Krizhevsky in collaboration with Ilya Sutskever and Geoffrey Hinton, who was Krizhevsky's Ph.D. advisor in the year 2000 **ALexNet (8 layers)** 3.55 M 4M 16M 4M 227 55 23 dense dense dense 2 256 9 256 MaxPooling 23 384 Convolution Convolution 55 384 Layer5 256 227 Convolution MaxPooling Layer4 1000 256 96 Layer3 Layer8 Convolution MaxPooling 4096 4096 Layer2 96 Layer7 Layer6 Convolution Layer1

Depth of filter is always depth of the input

Input

ALexNet (8 layers)

Input: $227 \times 227 \times 3$

Conv1: K = 96, F = 11

S = 4, P = 0

Output: $W_2 = 55$, $H_2 = 55$

Parameters: $(11 \times 11 \times 3) \times 96 = 34K$

Max Pool Input: $55 \times 55 \times 96$

F = 3, S = 2

Output: $W_2 = 27$, $H_2 = 27$

Parameters: 0

Input: $27 \times 27 \times 96$

Conv1: K = 256, F = 5

S = 1, P = 0

Output: $W_2 = 23, H_2 = 23$

Parameters: $(5 \times 5 \times 96) \times 256 = 0.6M$

Max Pool Input: $23 \times 23 \times 256$

F = 3, S = 2

Output: $W_2 = 11, H_2 = 11$

Parameters: 0

Input: $11 \times 11 \times 256$

Conv1: K = 384, F = 3

S = 1.P = 0

Output: $W_2 = 9$, $H_2 = 9$

Output: $W_2 = 9, H_2 = 3$

Parameters: $(3 \times 3 \times 256) \times 384 = 0.8M$

Input: $9 \times 9 \times 384$

Conv1: K = 384, F = 3

S = 1.P = 0

Output: $W_2 = 7$, $H_2 = 7$

Input: $7 \times 7 \times 384$

Conv1: K = 256, F = 3

S = 1.P = 0

Output: $W_2 = 5, H_2 = 5$

Max Pool Input: $5 \times 5 \times 256$

F = 3.S = 2

Output: $W_2 = 2$, $H_2 = 2$

Parameters: 0

FC1

Parameters: $(2 \times 2 \times 256) \times 4096 = 4M$

FC1

Parameters: $(3 \times 3 \times 384) \times 384 = 1.327M$ Parameters: $(3 \times 3 \times 384) \times 256 = 0.8M$

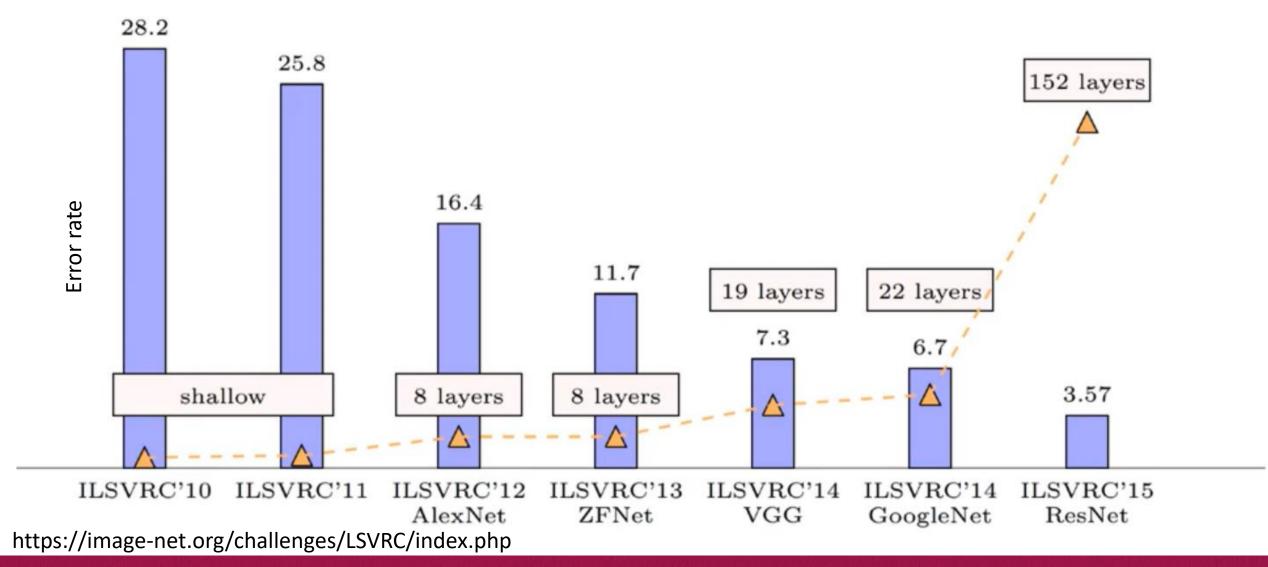

Parameters: $4096 \times 4096 = 16M$

FC1

Parameters: $4096 \times 1000 = 4M$

Total Parameters: 27.55M

ImageNet Large Scale Visual Recognition Challenge (ILSVRC)

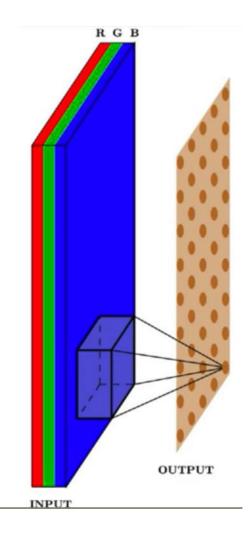

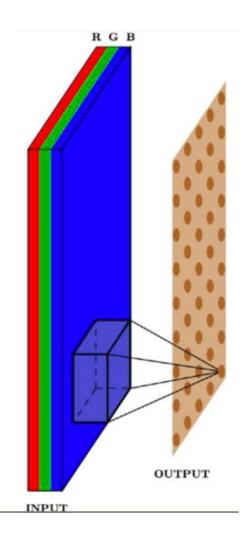

Convolutional Neural Network Architectures GoogLeNet

No: of computations in CNN

No: of computations in CNN

Assume S=1, and with appropriate padding WI=Wo=W and HI=Ho=H

Each pixel takes FxFxD computations
There are Wo x Ho such pixels

Each pixel need a computation of WIxHI

So total computations WoxHoXFxFxD

Note that computation depends on D the depth (Intermediate layers may have bigger depth as no of filters)

GoogLeNet - Intuitions

Choice of filters- Parallel Convolutions and Max-pooling Reduce the number of parameters- Average pooling Reduce the computations – 1x1 Convolutions

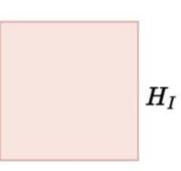

Deeper Networks

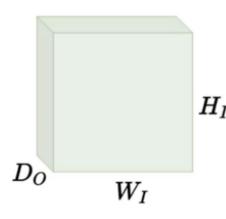

1x1 Convolution

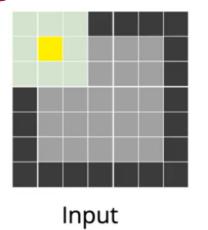

If we use $D_O(< D_I)$ such filters we will get output volume of size $W_I \times H_I \times D_O$

(Filter of size 1x1) D_I

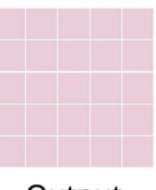

Maxpooling with S=1, F=3, P=1

 H_I

Output

Intuitions behind GoogleNet

It is computationally intensive to use many filters K which increases the depth (D1) of output. 1x1 convolution which basically does weighted average helps in shrinking the volume from DI to Do(Do<D1) but at retaining the values to some extend. So this intermediate step helps in reducing the complexity by shrinking the intermediate inputs (Do kernels used)

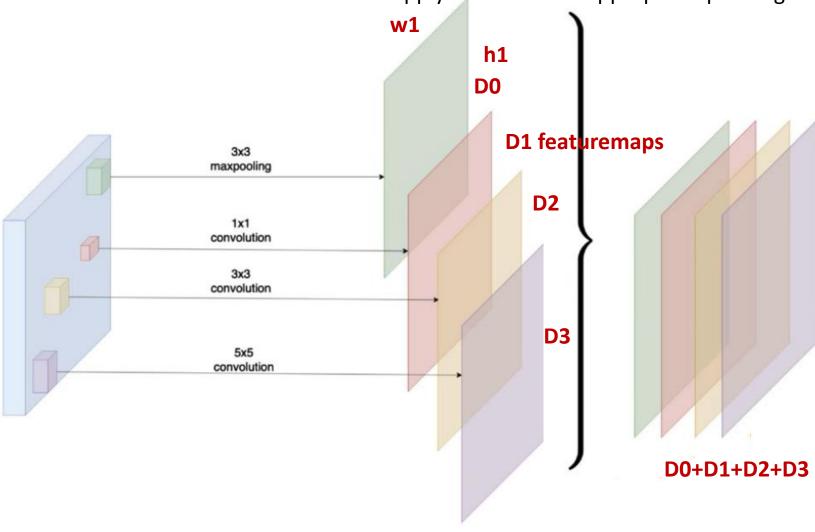

When we do maxpooling with S=1 and P=1 when F=3 we get an output of same size.

Similarly S=1,P=2 when F=5 So a stride of 1 and appropriate padding help us in retaining size of output.

 D_I

Intuition Behind GoogLeNet

Apply Stride =1 and appropriate padding to retain same output size as input

Until now, in the architectures we had seen variations in the hyper parameters .

- How many filters to use and what should be filter size?
- What should be arrangement of max-pooling and convolutional layers?
- How many max pooling how many convolutional layers?
- Intuition behind GoogLeNet-Why to make that decision . Do everything on the same input and get a set of feature map outputs in one go- Inception Module

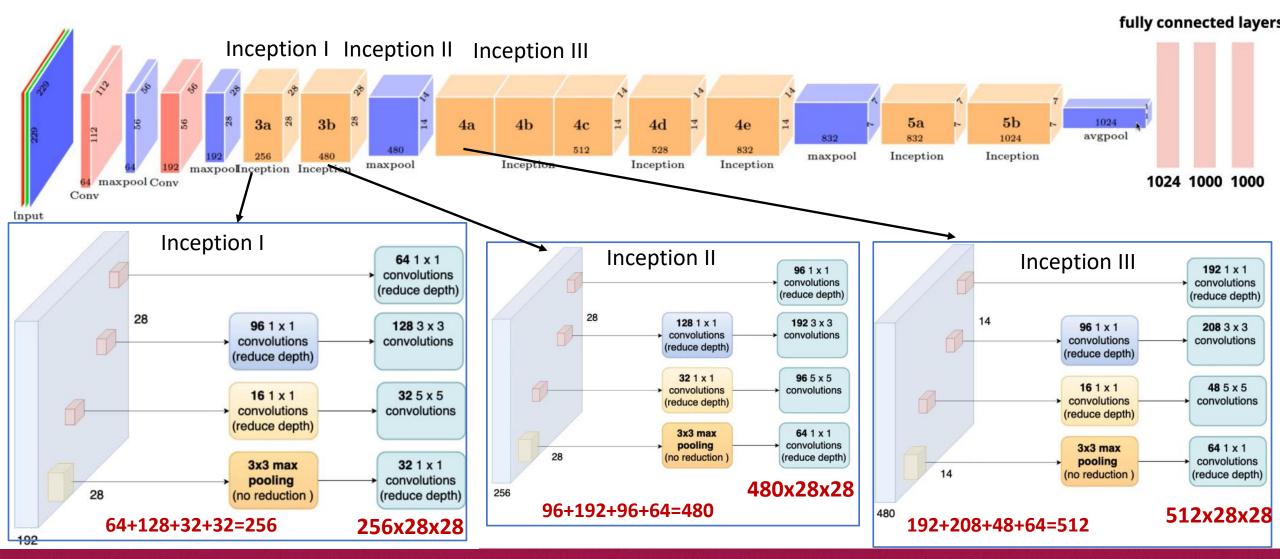

When we have back to back convolutions, filter size can be smaller(5x5 or 3x3)

Inception Module in GoogLeNet

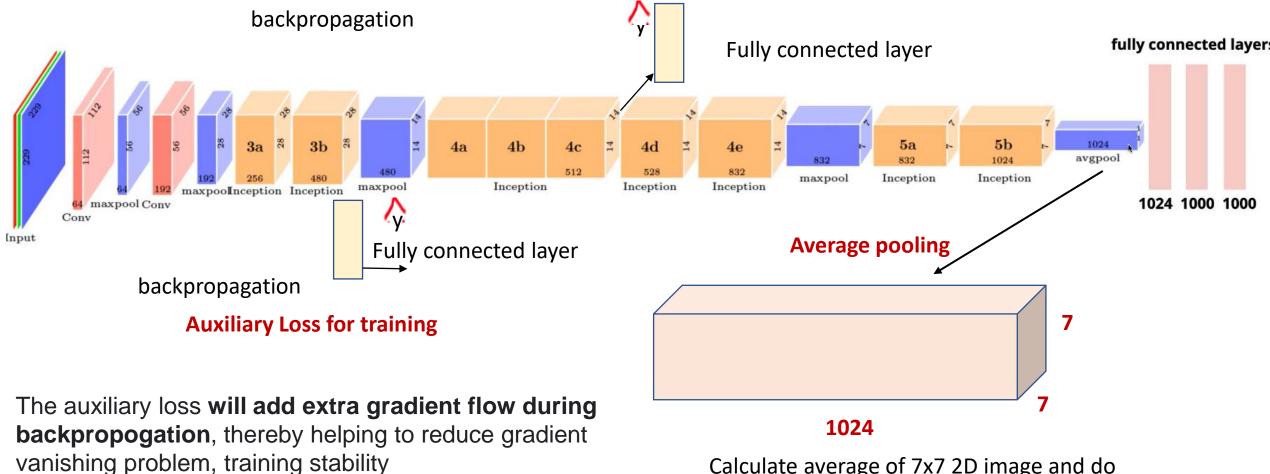

Apply Stride =1 and appropriate padding to retain same output size as input Inception module 96x28x28 961x1 convolutions (reduce depth) 28 128x28x28 192x28x28 28 128 1 x 1 1923x3 convolutions convolutions (reduce depth) reduction 32x28x28 96x28x28 965x5 convolutions convolutions (reduce depth) reduction 64x28x28 641x1 3x3 max 28 256x28x28 pooling convolutions 28 (no reduction) (reduce depth) reduction S=1,P=1 448 256 96+192+96+64=448

GoogLeNet Architecture

GoogLeNet Architecture- Average Pooling, Auxiliary Loss for training

Calculate average of 7x7 2D image and do it depthwise resulting in a 1D vector of 1024

Conclusion

Choice of filters- Parallel Convolutions and Max-pooling Reduce the number of parameters- Average pooling Reduce the computations – 1x1 Convolutions

Deeper Networks

Convolutional Neural Network Architectures VGG 16

VGG16

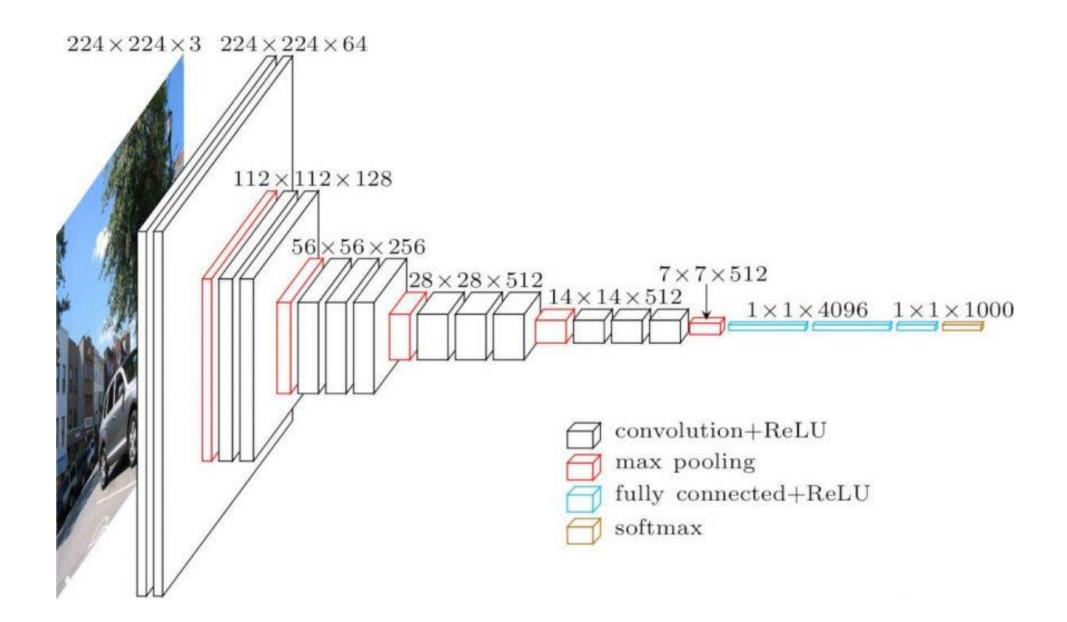

VGG16 is a convolutional neural network model proposed by K. Simonyan and A. Zisserman from the University of Oxford in the paper "Very Deep Convolutional Networks for Large-Scale Image Recognition" in 2015. The model achieves 92.7% top-5 test accuracy in ImageNet, which is a dataset of over 14 million images belonging to 1000 classes. It was one of the famous model submitted to ILSVRC-2014. It makes the improvement over AlexNet by replacing large kernel-sized filters (11 and 5 in the first and second convolutional layer, respectively) with multiple 3×3 kernel-sized filters one after another. VGG16 was trained for weeks and was using NVIDIA Titan Black GPU's.

The authors give the intuition behind this that having two consecutive 2 consecutive 3x3 filters gives an effective receptive field of 5x5, and 3 - 3x3 filters give a receptive field of 7x7 filters, but using this we can use a far less number of hyper-parameters to be trained in the network.

VGG-16

- \triangleright Kernel size is 3×3 throughout
- ▶ Total parameters in non FC layers = $\sim 16M$
- ► Total Parameters in FC layers = $(512 \times 7 \times 7 \times 4096) + (4096 \times 4096) + (4096 \times 1024) = \sim 122M$
- ▶ Most parameters are in the first FC layer ($\sim 102M$)

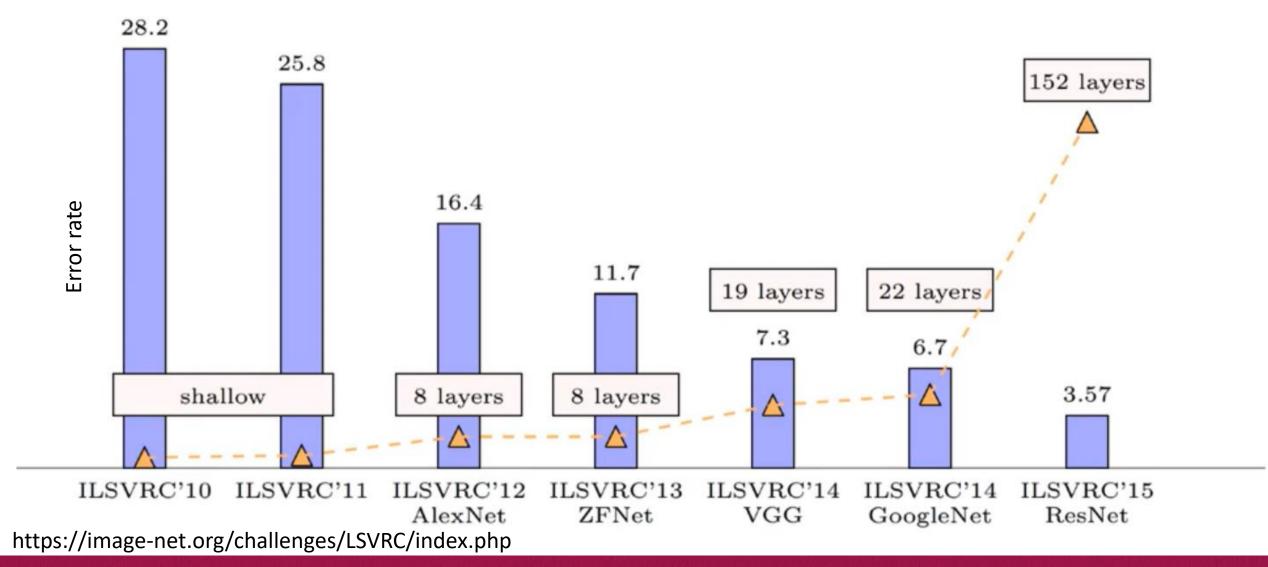

Convolutional Neural Network Architectures ResNet

Winner of ILSVRC 2015 (Image Classification, Localization, Detection)

ImageNet Large Scale Visual Recognition Challenge (ILSVRC)

ResNet

ResNet introduces skip connection (or shortcut connection) to fit the input from the previous layer to the next layer without any modification of the input. Skip connection enables to have deeper network and finally ResNet becomes the Winner of ILSVRC 2015 in image classification, detection, and localization, as well as Winner of MS COCO 2015 detection, and segmentation. This is a 2016 CVPR paper with more than 19000 citations

ImageNet, is a dataset of over 15 millions labeled high-resolution images with around 22,000 categories. ILSVRC uses a subset of ImageNet of around 1000 images in each of 1000 categories. In all, there are roughly 1.2 million training images, 50,000 validation images and 100,000 testing images.

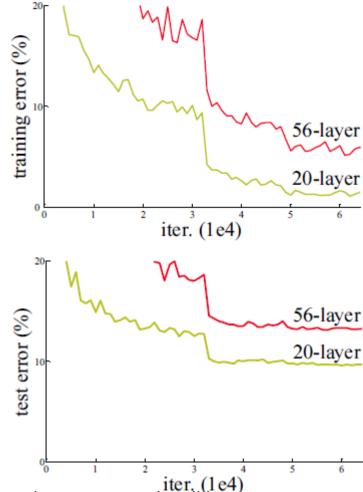

Background-Problems of Plain Network

For conventional deep learning networks (Plain Network), having conv layers then fully connected (FC) layers for classification task like AlexNet, ZFNet and VGGNet, When the plain network is deeper (layers are increased), the problem of vanishing/exploding gradients occurs.

Vanishing/exploding gradients

- During backpropagation, when partial derivative of the error function with respect to the current weight in each iteration of training, this has the effect of multiplying n of these small / large numbers to compute gradients of the "front" layers in an n-layer network
- When the network is deep, and multiplying *n* of these small numbers will become zero (vanished).
- When the network is deep, and multiplying *n* of these large numbers will become too large (exploded).

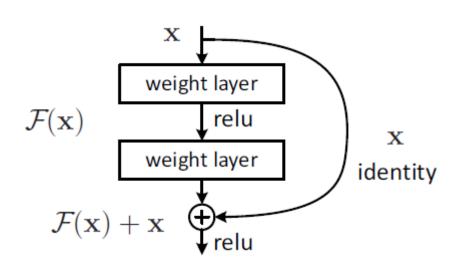

iter. (1e4)
We expect deeper network will have more accurate prediction.
However, above shows an example, 20-layer plain network got lower training error and test error than 56-layer plain network, a degradation problem occurs due to vanishing gradients.

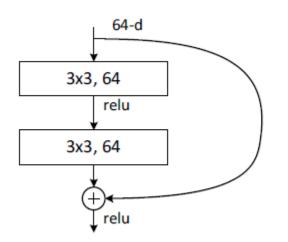

Skip / Shortcut Connection in Residual Network (ResNet)

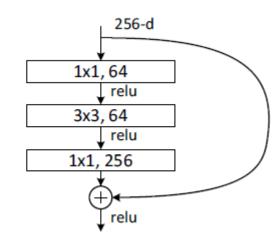

To solve the problem of vanishing/exploding gradients, a skip / shortcut connection is added to add the input x to the output after few weight layers as below:

A Building Block of Residual Network

Bottleneck Design

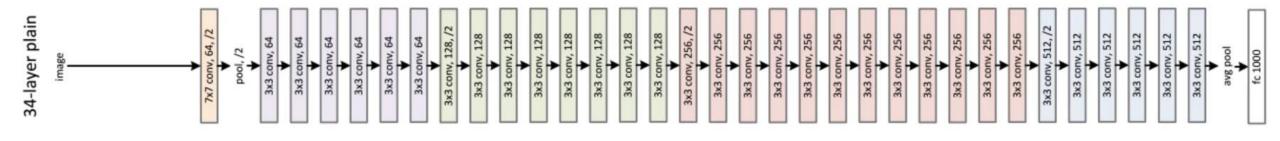

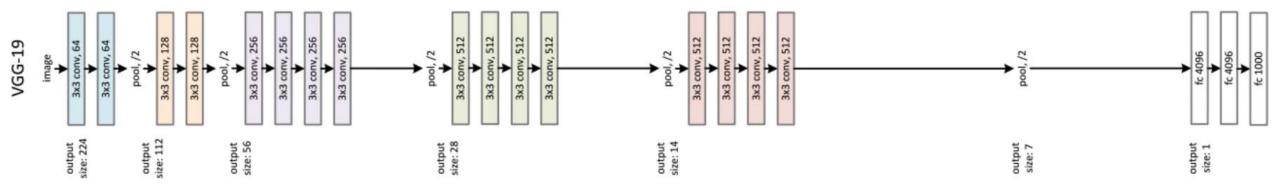

Hence, the output H(x) = F(x) + x. The weight layers actually is to learn a kind of residual mapping: F(x) = H(x) - x. Even if there is vanishing gradient for the weight layers, we always still have the identity x to transfer back to earlier layers.

The 1×1 conv layers are added to the start and end of network as in the figure (right). This is a technique suggested in Network In Network and GoogLeNet (Inception-v1). It turns out that 1×1 conv can reduce the number of connections (parameters) while not degrading the performance of the network so much

Towards ResNet Architecture

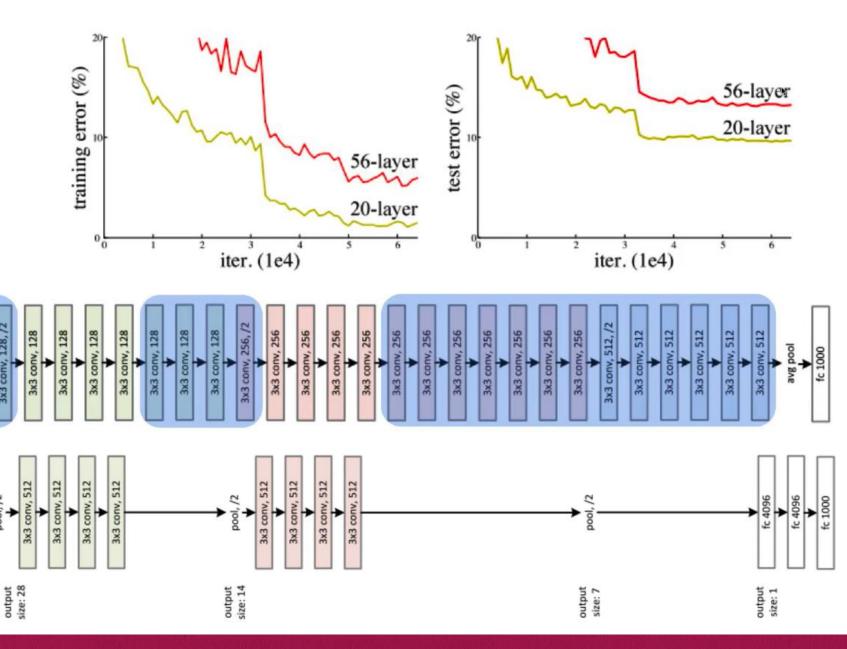

VGG -19 was added with more convolutional layers making it 34 layer, expecting better performance(being deeper) which it did not give as expected :-(. What went wrong??

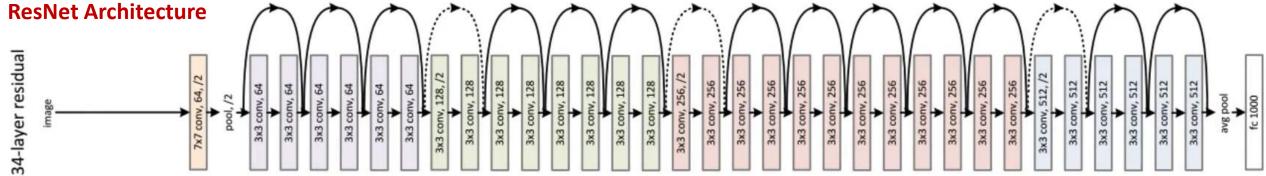

Towards ResNet Architecture

When network grows deeper input is getting transformed significantly and by the time it reaches the last layer, it is messing up the input due to many transformations

34-layer plain

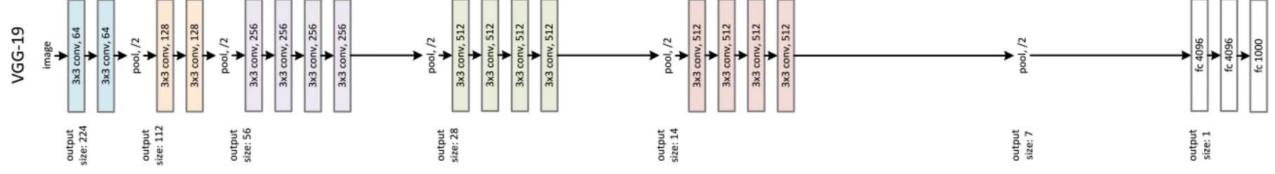

VGG-19

34-layer residual network (ResNet) (top) is the plain one with addition of skip / shortcut connection.

34-layer plain network (middle) is treated as the deeper network of VGG-19, i.e. more conv layers.

The VGG-19 (bottom) is a state-of-the-art approach in ILSVRC 2014.

With the bottleneck design, 34-layer ResNet become 50-layer ResNet. And there are deeper network with the bottleneck design: ResNet-101 and ResNet-152.
